Abstract

This report presents a system for classifying nineteenth century and early twentieth century material culture from archaeological contexts. It consists of three parts, a codebook, a codebook manual, and a computer software package. The codebook provides a system for classifying artifacts and artifact fragments according to material of manufacture as well as form, organized to segregate material, style, and manufacturing techniques of functional and chronological significance. The codebook manual contains instructions for making critical classification decisions along with illustrations and references to facilitate the process. The software manual is not compatible with the current version of the codebook but is an illustration of the utility of computer assisted enumeration and retrieval.

Preface and Acknowledgements

Recognizing that the excavation at the extinct nineteenth century townsites of Colbert, Barton and Vinton, Mississippi would result in a huge return of artifacts, as well as complex data manipulation problems representative from the Tombigbee Historic Townsites Project, the Park Service-Mid Atlantic Region and the Corps of Engineers-Mobile determined to design and produce a system which would facilitate the classification and computer manipulation of recovered artifacts.

It was initially hoped that this system would be available in time to use for the classification of material from other nineteenth century sites being excavated within the Tombigbee River Multi-Resource District of the Tennessee-Tombigbee Waterway. Unfortunately this was not to be since the design and testing of the system took far longer than was originally anticipated. While it was recognized from the beginning that the system was to represent the first step in a classification and retrieval scheme which would evolve through use, the difficulties of producing a working system were underestimated.

Essentially, the system as it now stands has evolved through three phases. The first was the design of the codebook and software. The second was a test of the system by coding the artifacts recovered from Colbert, Barton, and Vinton. The third, in part concurrent with the second phase, was the redesign of the codebook, preparation of the manual, and fine tuning of the retrieval software. In fact, the lessons learned in coding pointed out some major problems with the categorization and as a result, the codebook was ultimately refined three times. Since the Colbert, Barton and Vinton material was coded under the first and second versions, artifacts coded from these sites are not in conformity with the present system. Further, the software package presented here has not been updated to work with the present version of the codebook and manual although it is compatible with the second version of the codebook published in the project's Phase II report (Minnerly 1983). It is included here to illustrate the capability of computer assisted retrieval. It is hoped that appropriate changes will soon be made in the software package to make it compatible with the present codebook as well as to make it more powerful and efficient in operation.

Designing a universal system for classifying all of nineteenth century material culture that can be used by cataloguers with minimal training is not an easy task. This attempt has had its vocal critics; among these are a number of experts in nineteenth century material culture who have devoted a great deal of energy in reviewing drafts of the codebook and manual. For their criticisms and many useful suggestions, great thanks is due to Bill Adams, Marley Brown, Olive Jones, George Miller, Randy Moir and Tef Roddeffer. It should be understood that these colleagues do not necessarily agree with the categorization suggested, the contents of the manual, nor even the feasibility of the system itself.

Of the Tombigbee Historic Townsites staff, special thanks is due to Bob Sonderman and Randy Donahue who devoted many hours beyond their formal association with the project and to Tia Maxwell, project artist who is responsible for the illustrations in the manual. W. Lee Minnerly, who spearheaded the project to begin with, was instrumental in developing most of the major concepts as well as contributing a major portion of the section on ceramics in the manual. Lee's important contributions are gratefully acknowledged.

Finally and most especially, thanks is due to Kim McBride, editor, typist, coordinator and all around dynamo who is responsible for getting the job done.

INTRODUCTION

The cataloguing and retrieval system which is presented in this codebook and identification manual was originally developed as an aid to the computer manipulation of collections resulting from the archaeological excavations of the Tombigbee Historic Townsites Project. This project, sponsored by the U.S. Army Corps of Engineers - Mobile, was undertaken by the Museum and Department of Anthropology at Michigan State University under contract with the U.S. Department of Interior, National Park Service, Mid-Atlantic region.

Archaeological work at the extinct Mississippi townsites of Colbert (1836-1847), Barton (1847-1865) and Vinton (1840-1910) produced a collection of over one million artifacts representative of the entire nineteenth century. Because of the dearth of systems designed to order and manipulate data of this period, it was decided to design an entirely new system which could be tested with artifacts from the Townsites Project and would, thereafter, be of general use to other researchers working with collections from this era.

This system has gone through three basic revisions; the trial and error process in regard to both the categorization of materials and the computer software has resulted in an improved system but not a perfect one. It has always been the intention to produce a system which will continue to be improved with use.

At the outset, it is necessary to state in concise terms what this system represents and what it is not. This coding system is designed to categorize artifacts according to a consistent scheme based upon the observable physical properties of artifacts and fragments of artifacts. Further, the system provides a means whereby artifacts and artifact fragments can be enumerated by archaeological provenience and retrieved according to provenience category for any artifact grouping, from most to least inclusive. The same results could be obtained by writing the provenience and artifact category on separate file cards and manually sorting these to arrive at a listing of all artifacts of a given provenience or all proveniences of a given artifact category. The computerized system suggested here merely expedites what is essentially a traditional cataloguing and retrieval system. Artifacts can of course be classified in this system without using a computer for retrieval; in fact, if collections are small the use of a computer is not recommended.

This system is not a typology and it should therefore not be used to address functional and structural problems which must depend on typological systems designed specifically to address problems of these types. Formally speaking, a typology is a definition based on regularized relationships between specific attributes of the objects being classified. The specificity of a typology must necessarily rest on the specificity of the attributes selected and the size of units observed. A typology therefore is an analytic exercise and each specific problem requires the design of an appropriate typology. This system is designed to expedite the retrieval of artifacts for subsequent formation of typologies.

Stanley South (1977) and Rodrick Sprague (1981) have, for example, offered useful typological systems for addressing structural and functional questions of historic period artifact assemblages. If we look at South's system we find a means of categorizing artifacts and artifact fragments according to functional sets, i.e., architectural group or activities group. These categories include artifacts made of different materials having different forms, and even serving different specific functions.

By grouping these artifacts within a single functional set and by testing the variability between several sets over time and space, South offers a typological means of testing hypotheses about regularity (patterning) of his defined sets. In fact, the means of testing the hypotheses rests not only on his typology of groups but the initial classification of artifacts with each group.

The fact that this system is not a typology does not mean that it lacks all analytic power. In fact the attributes chosen as a basis for coding often exhibit structural, functional or chronological significance. Thus a medicinal bottle is a functional type, shares certain attributes of structure and style with other bottles, and if it exhibits a specific type of solarization, it may be of a specific age. Since bottles can be retrieved according to the categories medicinal/solarized or medicinal/unsolarized, it is often possible to learn a great deal about the age or function of a specific level, or site using the categories uncoded here. Insofar as possible, the categories used in this system are reflective of manufacturing process and chronology of manufacturing process and style change.

Even though this is true, the system is not designed to provide these kinds of data in a consistent or systematic fashion, that is from one attribute class to the next. Thus, the categories pressed glass, lead glass and solarized glass are defined by different kinds of attributes and these need not be mutually exclusive.

The attributes selected in the design of this system were chosen so the result would be widely applicable and so the attributes could be easily coded by cataloguers who have minimal familiarity with nineteenth century material culture. It is recognized that the more difficult the system, the more costly it will be in terms of both money and cataloguer error. For these reasons, the much more inclusive approach taken in designing systems like those used by the Canadian Historic Sites Service, Parks Canada was avoided. Though excellent systems, their use requires highly trained cataloguers and considerable expense. In order to design a less complex system, it was necessary to find a balance between the general and the specific, to sacrifice detail for clarity and to preserve detail for utility. This is, however, not only difficult, but it leads to disappointment by almost everyone in those particular areas of their speciality.

Apart from what some will undoubtedly see as a sacrifice of detail, a system of this type must necessarily suffer problems due to the way it is organized and the reality of manufacture. In the latter regard it is

necessary to note that while the coding system is based on the material from which an artifact is manufactured, many items are made of more than one material. The coding of a glass lamp font with an attached metal stand requires an arbitrary decision, since coding the artifact in two places will confuse enumeration. As a guide line, an artifact made of more than one material should be coded to reflect its most informative aspects, whether these reflect function, chronology, or style. Thus, in the example above, if the font is more instructive than its metal base, it should be coded as glass, irrespective of the relative size or completeness of its component parts.

Other problems arise due to the choice of particular attributes for subcategorization--these are noncorrectible structural weaknesses in the system. For example, whole bottles are categorized according to major method of manufacture because these methods can only be determined from complete or nearly complete specimens. Lip and neck fragments are, however, categorized by techniques specific to the finish of the bottle. If one is interested in lips manufactured with finishing tools these specimens would be retrieved from among the lip/neck fragments. Since whole bottles are not coded according to this attribute, however, it would be necessary to retrieve all whole bottles and then examine their lips to determine which were manufactured using finishing tools. Such structural problems can only be overcome by constructing a very complex system which would have its own substantial faults.

The descriptive narrative of the manual provides a key to designation attributes which are critical to classificatory decisions. Introductory paragraphs contain general information about each major category which are based on material type, i.e., ceramics, metal artifacts, etc. These statements are not meant to be exhaustive but to provide the minimal background necessary for making judgements concerning the future subcategories of artifacts within each category, such as earthenware, stoneware, or porcelain for ceramics. The sections of the manual which deals with each subcategory is designed to illustrate the variety of types and/or to explain attributes used to differentiate within the sub-categories. When necessary, illustrations are provided along with bibliographical citations to works which will provide more detail on variability within the subcategories.

Finally, it is emphasized that this system and the manual is a relatively ambitious and unique archaeological endeavor. It is hoped that it will be used and improved by others working with nineteenth and early twentieth century material culture and further that this system will provide the beginnings of a standardized descriptive inventory toward broader comparisons of artifacts and artifact assemblages.
